

As a user I want to quickly and easily take notes that are then saved into my dmx database. Afterwards, when accessing the database from a computer, I want to review the notes and make changes as necessary.

When taking notes I should be able to tag/color code them for easy categorization. I should also be able to choose a topicmap (and a default topicmap) where the created notes are displayed.

Using the plugin, I want to save server and login data so that I don't have to separately input them every time. Optimally I would be able to save notes even without connection to my dmx database and load them into the database once there is connection.
